ANIMAL HEALTH CARD

GRAD NOITDA

Examples of how to use Interaction Cards to your advantage or against your opponent:

The above examples are not exhaustive of all the different ways to play Interaction Cards, which can be used to challenge or cancel Action Cards, Animal Health Cards and Animal Cards that you yourself have drawn or that your opponent has played. They can also be played on their own to have implications independent of any other cards.

THE GAME THAT TEACHES YOU

HOW TO BEAT THE VIRUS

The purpose of this game is to be an educational tool used to explore concepts of coronavirus disease prevention and transmission, in both humans and animals. Although this activity was conceived and developed for player entertainment and enjoyment, it is not meant to trivialise, undervalue or disrespect the impact that COVID-19 has had on the lives of so many people across the globe. Instead, the goal is to increase understanding and re-enforce positive day-to-day actions and behaviours that will prevent the spread of disease..

Target Audience: Anyone over 10 years of age.

In addition to recreation, this activity can be explored in the context of education in primary and secondary schools, Science Museums or Centres and summer camps.

Number of players: 2 to 6 players.

Purpose of the game: To be the first to complete the route round the board with a healthy animal.

Game components:

1 board with 94 spaces.

2 dices.

6 pawns.

1 deck of Action Cards (60 cards); these relate to human behaviour and will tell the player to move forwards or backwards on the board.

1 deck of Animal Health Cards (30 cards); these state the health of the player's animal.

1 deck of Interaction Cards (56 cards); these allow a player to interact with others and also counteract the orders on the Action cards.

1 deck of Animal Cards (6 cards); each player must have one double-sided animal card. The health condition of the animal is determined by whichever side is facing upwards.

Setting up the game:

- Each player must choose a pawn to play with.
- An Animal Card is picked at random by each player.
- Animal Health Cards are placed in a pile on the board face-down; they are only drawn if a player lands on the corresponding space on the board.
- Action Cards are stacked on the table, face down; as they are drawn, the player must read the card aloud and place it face up next to the deck.
 - a. Once the stack has ended, the used Action Cards can be flipped re-forming the stack.
- Interaction Cards should be dealt face-down to each player; the remainder are placed in a pile on the board face-down.

- The player who obtains the highest value in an initial roll of the dice begins.
- The game is played counter-clockwise.
- The game starts with all pawns on the white arrow, the number of spaces each one may advance on each go is determined by the number rolled on the dice.
- If the player lands on the action card symbol they should draw an Action Card and carry out the instructions on it.
- If the player lands on the Interaction Card symbol, they should draw an Interaction Card and keep it to use when they best see fit.
 - a. A player can use 1 of their Interaction Cards after drawing the Action Card.
 - b. Rotating clockwise the other players get a chance to use 1 of their Interaction Cards against the player whose turn it is; up to a maximum of 2 cards can be used per round.
 - c. The player can retaliate with 1 Interaction Card for each card used against them.
 - d. Once the round has finished the used cards should be returned to the bottom of the Interaction Card pile
- If the player lands on the Animal Health Card symbol they should draw an Animal Health card and carry out the instructions on it.
- If a player lands on the dice symbol, they can re-roll the dice but cannot pick up any cards following the second roll.
- Players told to move forwards, backwards or roll again by Action Cards or by the board also cannot pick up cards after moving.
- If the player lands on the coronavirus symbol, their animal becomes infected and their Animal Card should be flipped to ill.
- 10. The 'vaccine' Interaction Card should remain next to the animal card until it is voided, after which it should be returned to the bottom of the Interaction Card pile.
- 11. If the player is instructed to eliminate an Interaction Card, an opponent should pick one from the players hand at random.
- 12. The coronavirus superstrain card can only be used against players who are in the 'danger zone' (red spaces) on the board.
 - a. If this is used, the animal is too unwell to continue and the player must restart the board with a healthy animal.
 - b. This cannot be used against an animal that has been adequately vaccinated.
- 13. The player who reaches the centre of the board with his healthy animal, wins and the game is completed.
 - a. To win, the player must land exactly on the final space. If the number rolled exceeds this, on reaching the final space they must then move backwards on the board.
- 14. If the players reach the centre with a sick animal, they must re-start the board with their animal.
