

PATTERNS OF *VESPA VELUTINA* INVASION IN WESTERN IBERIA AND ITALY AS REVEALED BY MOLECULAR MARKERS

Andreia Quaresma¹; Dora Henriques¹; Joana Godinho²; Xulio Maside⁴; Laura Bortolotti³; M. Alice Pinto¹

¹Mountain Research Centre, Polytechnic Institute of Bragança, Bragança, Portugal

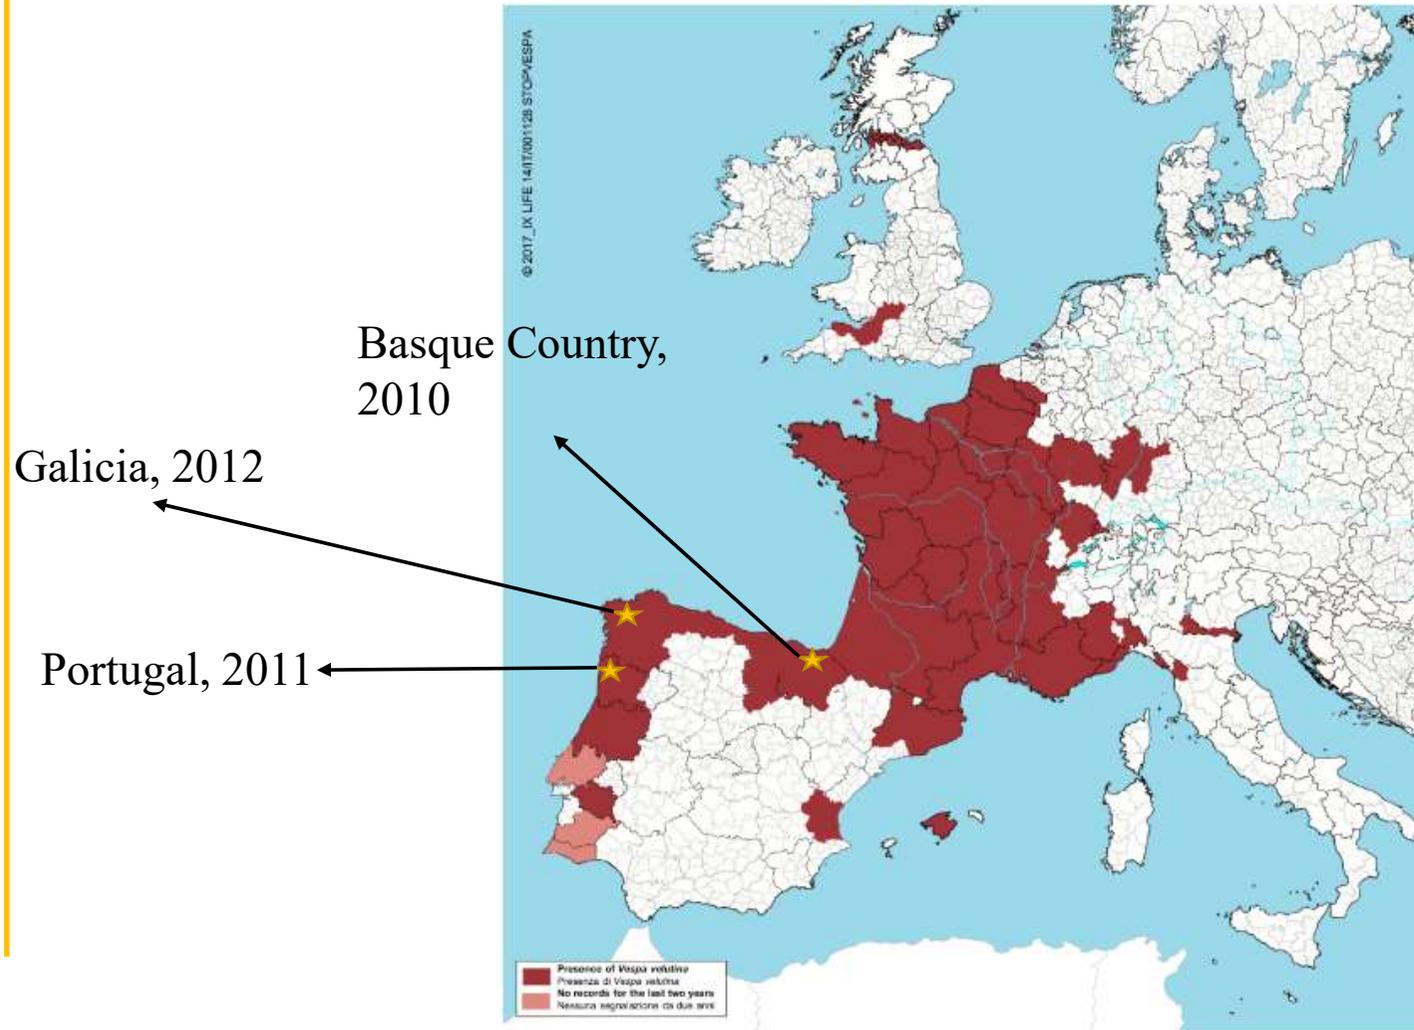

²National Institute of Agrarian and Veterinary Research, I.P. (INIAV), Oeiras, Portugal

³Honey bee and Silkworm Research Unit (CRA-API), Council for Agricultural Research and Agricultural Economy Analysis, Bologna, Italy

⁴Departamento de Anatomía Patolóxica e Ciencias Forenses, Grupo de Medicina Xenómica, CIMUS, Universidade de Santiago de Compostela, Santiago de Compostela, Spain; Xenómica Comparada de Parasitos Humanos, Instituto de Investigación Sanitaria de Santiago (IDIS), Santiago de Compostela, Spain.

INVASIVE AREAS OF VESPA VELUTINA

Successful invasion of European countries:

- 2004 - France
- 2010 – Basque Country, Spain
- 2011 – Belgium and Portugal
- 2012 – Galicia, Spain
- 2013 – Italy
- 2014 – Germany
- 2016 – UK
- 2017 – Switzerland

THREAT

Invasive species - major threat to the local biodiversity, through predation, competitive displacement and diseases.

Vespa velutina - generalist predator, consuming a large variety of insects (honeybees, *Vespula* spp. or Diptera) and scavenging a variety of proteins (fish or shrimp) and fruits.

Represents a serious threat to the Beekeeping in Europe

SAMPLES

Microsatellites:

Portugal = 190

Spain = 45

Italy = 11

Total = 246

MtDNA:

Portugal = 22

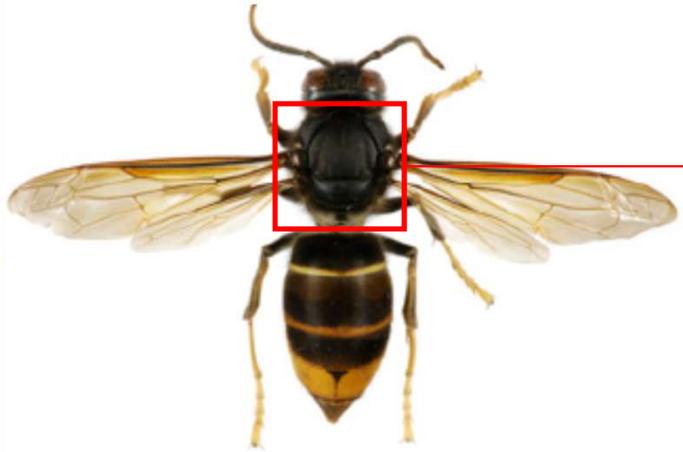

Spain = 13

Italy = 3

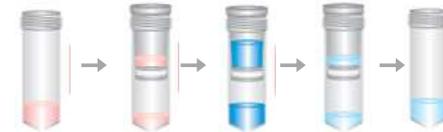

Total = 38

MICROSATELLITES

DNA extraction

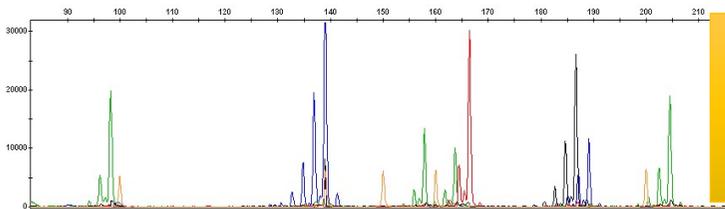

PCR

Capillary electrophoresis
(ABI 3730x1 DNA Analyzer,
Applied Biosystems)

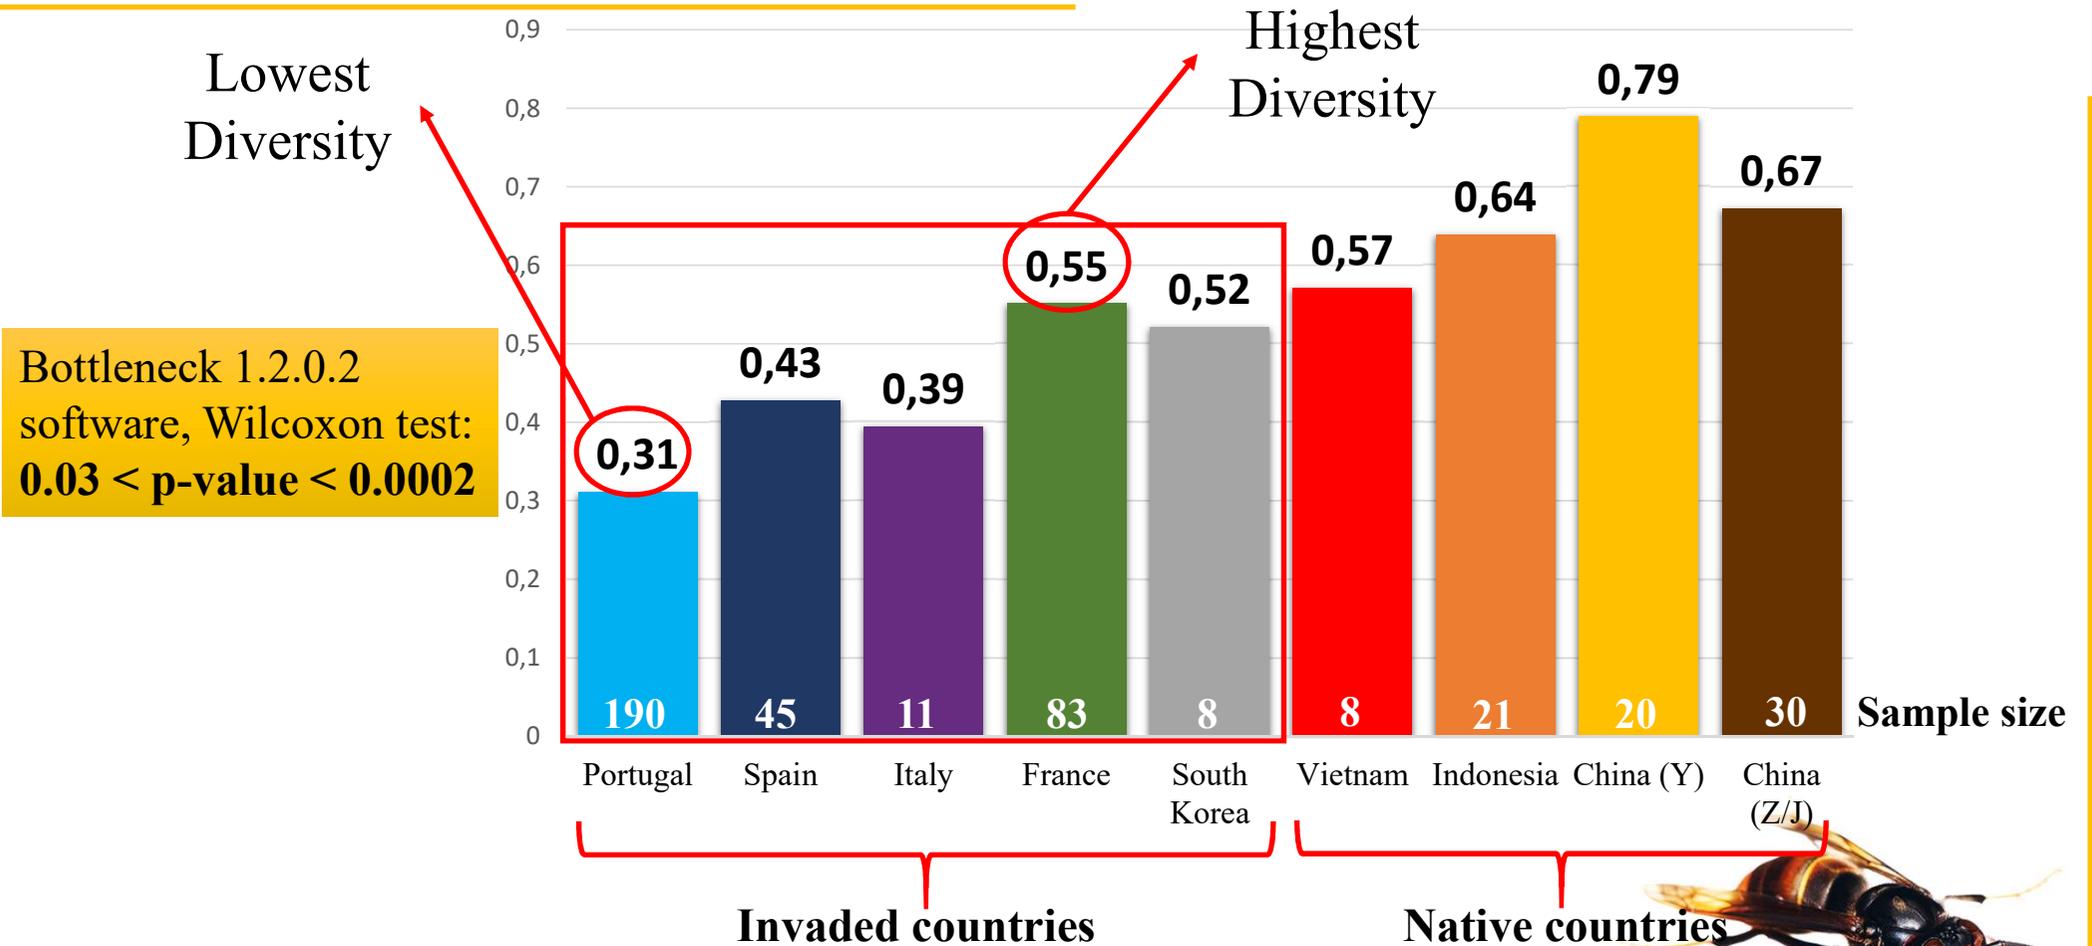

21 dinucleotide microsatellite loci
developed by Hasegawa and
Takahashi (2002), Daly *et al.*
(2002) and Arca *et al.* (2011)

Genotyping
(GeneMapper 3.7,
Applied Biosystems)

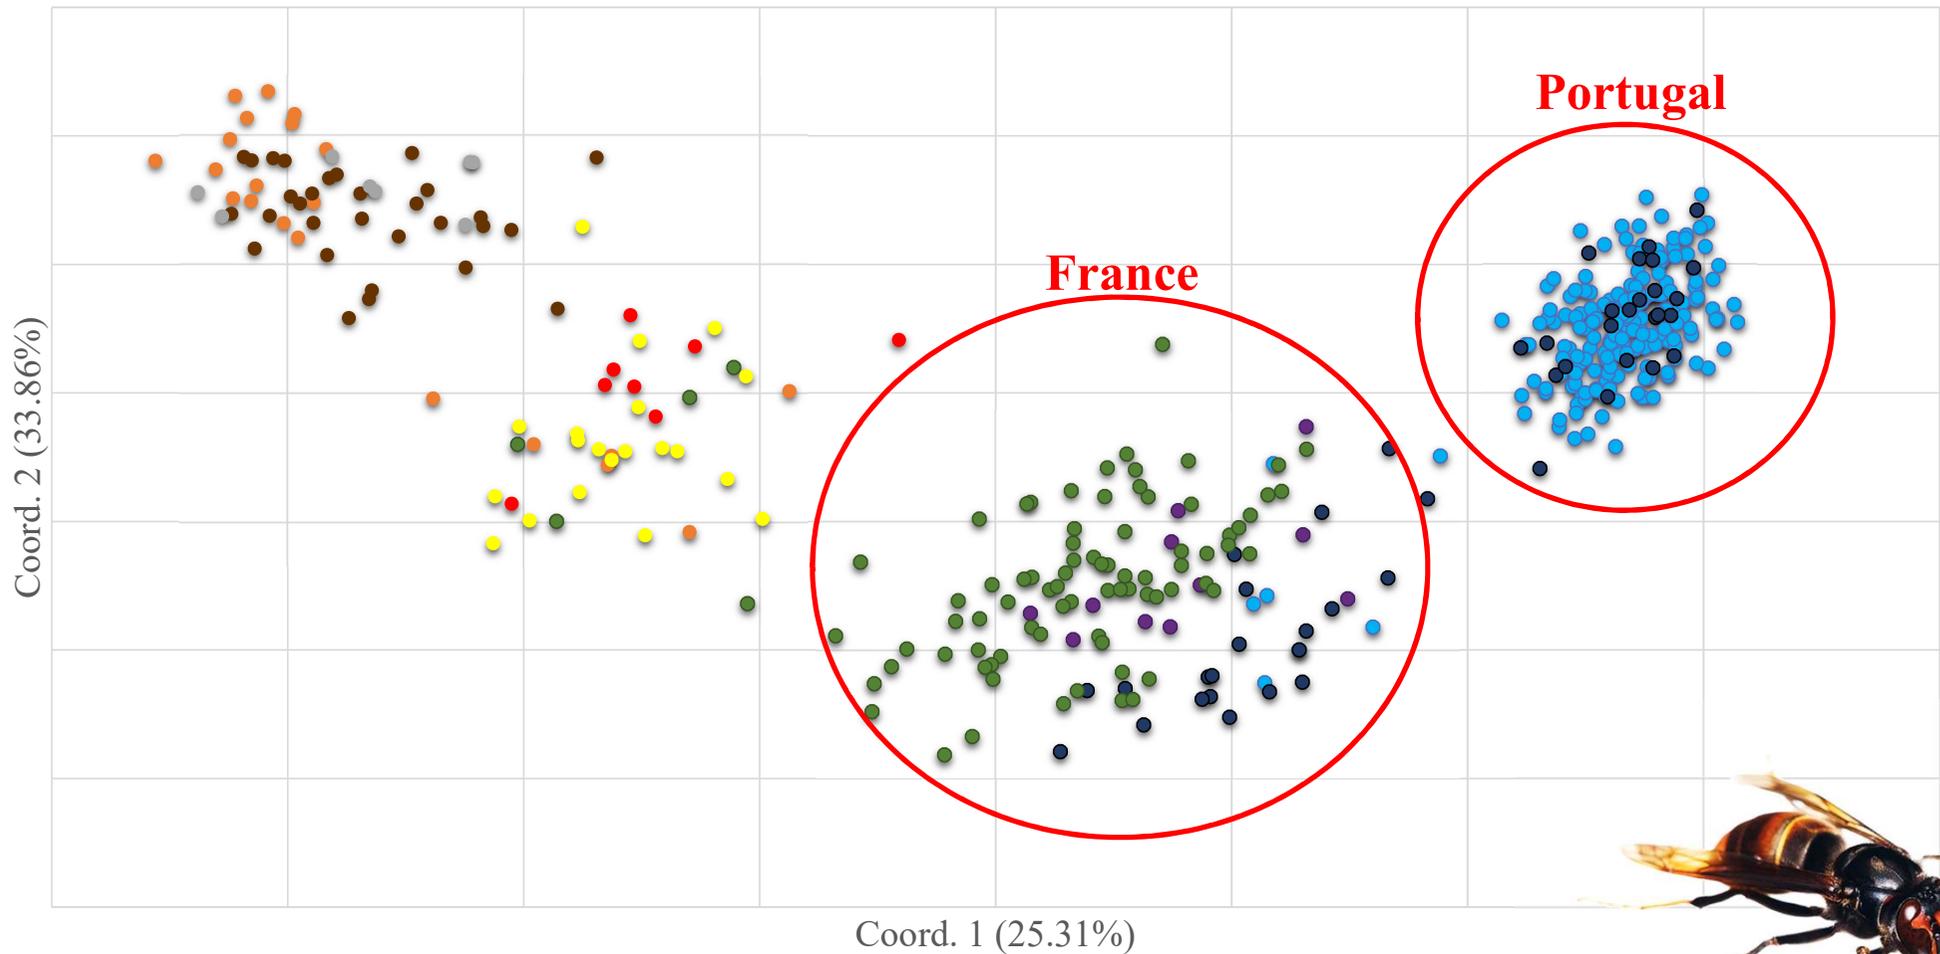

GENETIC DIVERSITY (UHE)

Reference populations from Asia and France (Arca *et al.* 2015)

GenAlEx 6.5 (Peakall and Smouse 2006)

PRINCIPAL COORDINATES (PCoA)

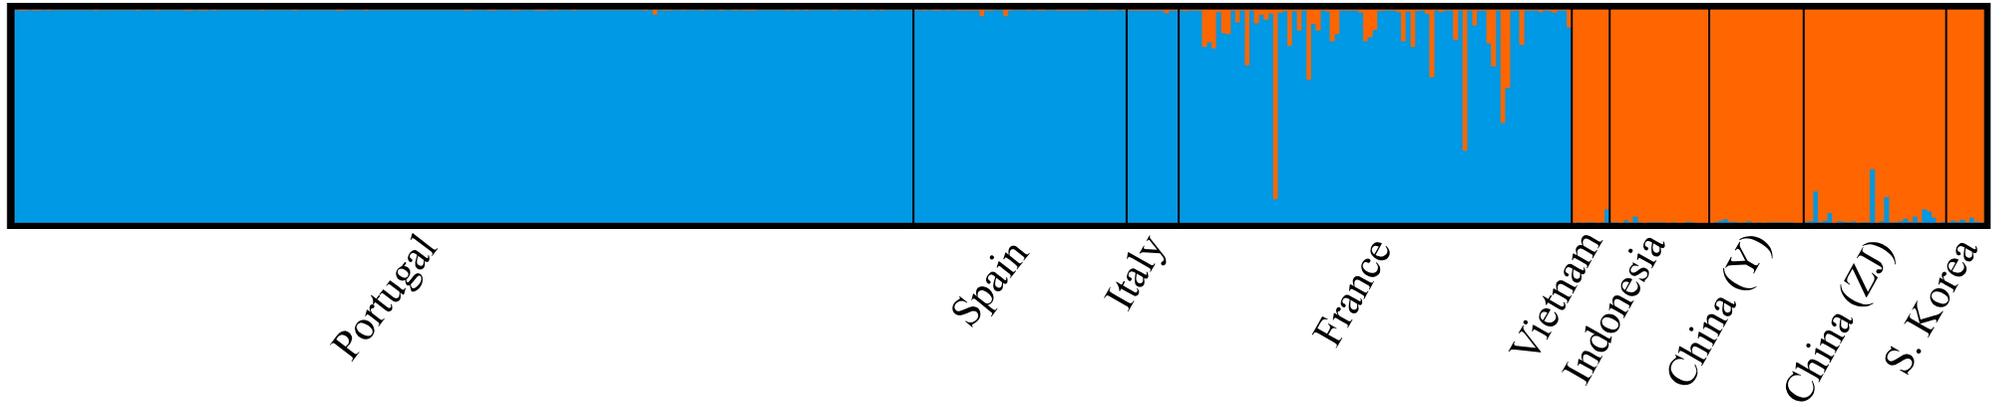

● Portugal ● Spain ● Italy ● France ● Vietnam ● Indonesia ● China (Y) ● China (ZJ) ● South Korea

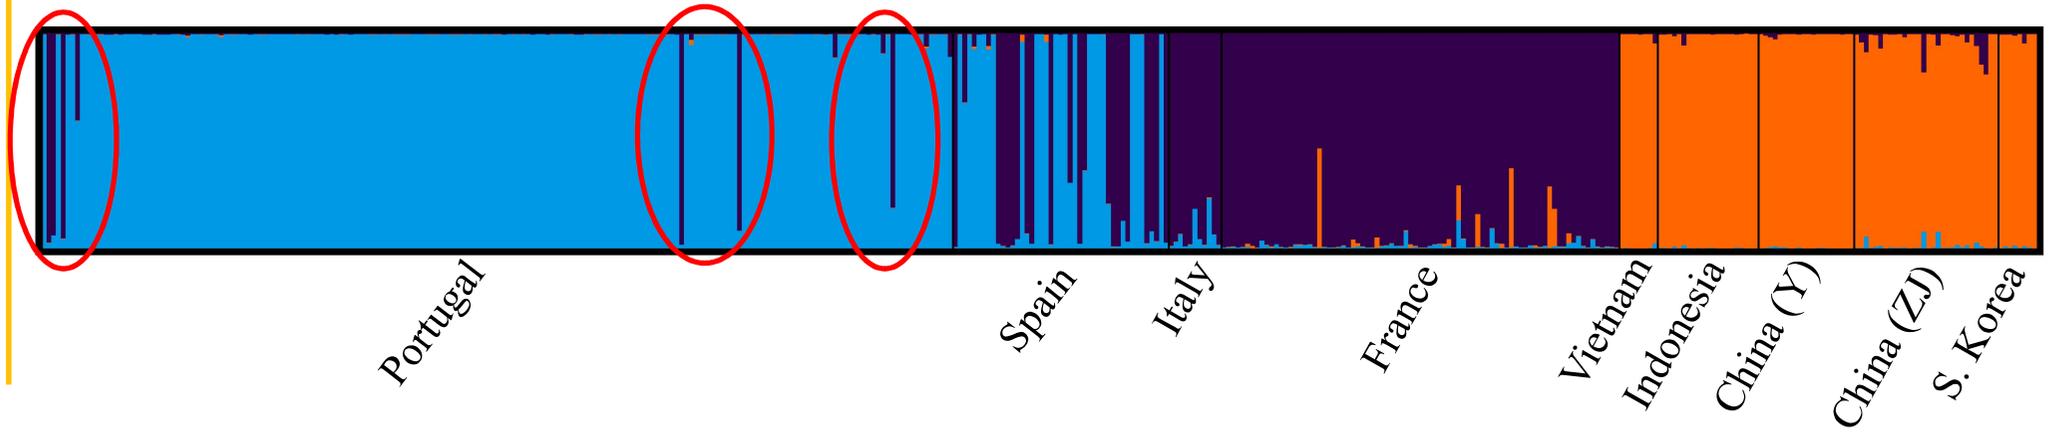

GenAlEx 6.5 (Peakall and Smouse 2006)

STRUCTURE ANALYSIS

MITOCHONDRIAL DNA

FINAL REMARKS

- ✓ Lower genetic diversity of invasive species, especially in Portugal;
- ✓ There are two (probable) ways of expansion:
 - A land expansion from France, through Pyrenees;
 - An independent entrance in Portugal (anecdotal reports of entrance in a cargo ship with wood)
- ✓ Some individuals in Portugal may have entered independently from the first Portuguese invasion through human transportation.
